Binary Search Tree

Binary Search Tree

Binary Search Tree

Binary Search Tree Runtimes

- ▶ Runs in $O(h)$ time:
 - ▶ Insert
 - ▶ Delete
 - ▶ Search
- ▶ h is the height of the tree.
- ▶ If tree is balanced and almost complete,
 $h = \log(n)$ where n is the total number of nodes.
- ▶ What is h if we insert in this order:
 - ▶ 1, 3, 4, 5, 6, 7, 8, 9, 10

Binary Search Tree

Self Balancing Trees

▶ AVL Trees

- ▶ Height limited to $1.44 \cdot \log(n)$
- ▶ $O(\log n)$ time for basic operations: insert, search, delete
- ▶ Complicated rules for tree rotation: Right-right, Right-left...

▶ Red-Black Trees

- ▶ Height limited to $2 \cdot \log(n)$
- ▶ $O(\log n)$ time for basic operations: insert, delete, search
- ▶ Properties to keep track of:
 - ▶ Root is black
 - ▶ All leaves are black
 - ▶ Both children of a red node are black
 - ▶ All path from a given node to its leaf nodes contains the same number of black nodes
- ▶ Rotations

Outline

- ▶ Trees
- ▶ **Skip Lists**
 - ▶ **Definition**
 - ▶ Insertion
 - ▶ Search
 - ▶ Deletion
- ▶ Conclusion

Skip List Motivation

- ▶ Implementation is generally easier than a self-balancing tree.
- ▶ Skip lists can be used in place of trees for most applications.
- ▶ Skip lists have a balanced behavior thanks to randomization.
- ▶ As the creator William Pugh says: “Skip lists are about as fast as highly optimized balanced tree algorithms and are substantially faster than casually implemented balanced tree algorithms.”

Probabilistic Algorithms

- ▶ **Monte Carlo Algorithms**
 - ▶ Guaranteed to be fast
 - ▶ Probably correct
- ▶ **Las Vegas Algorithms**
 - ▶ Guaranteed to be correct
 - ▶ Probably fast
- ▶ What are skip lists?

Skip List

- ▶ Lowest level of a skip list is a linked list.

Skip List

- ▶ Ideally:
 - ▶ Level 0 contains all links to all nodes in the list.
 - ▶ Level 1 contains $\frac{1}{2}$ of all of the elements in Level 0.
 - ▶ Level 2 contains $\frac{1}{2}$ of all of the elements in Level 1.
 - ▶ ...
- ▶ It is possible for all elements to be at Level 0 and have no elements at Level 1.

Skip List

- ▶ This is an unlucky skip list:

Skip List

- ▶ This is an normal skip list:

Outline

 - ▶ **Insertion**
 - ▶ Search
 - ▶ Deletion
- ▶ Conclusion

Skip List

► Initial Skip List:

Example

- ▶ Insert 5, 3, 6, 4, 2, 1, 9, 7 into a skip list.
- ▶ Levels must be 0, 1 or 2.

Skip List Insertion

Insert x into skip list:

Run search to find the appropriate location to place x .

Find the greatest number less than x .

Find the smallest number greater than x .

$\text{level} \leftarrow 0$

while(coin flip is heads)

{

$\text{level} \leftarrow \text{level} + 1$

}

Place node x at level and reassign arrows as necessary.

Insertion

► Initial Skip List:

Insertion

► Insert 4:

Insertion

► Insert 4:

Insertion

► Insert 4:

Quick Question

- ▶ Insert 8, has 2 levels.
- ▶ Insert 2, has 4 levels.

Insertion

- ▶ Insert 6 with 1 level:

Insertion

- ▶ Insert 6 with 1 level:

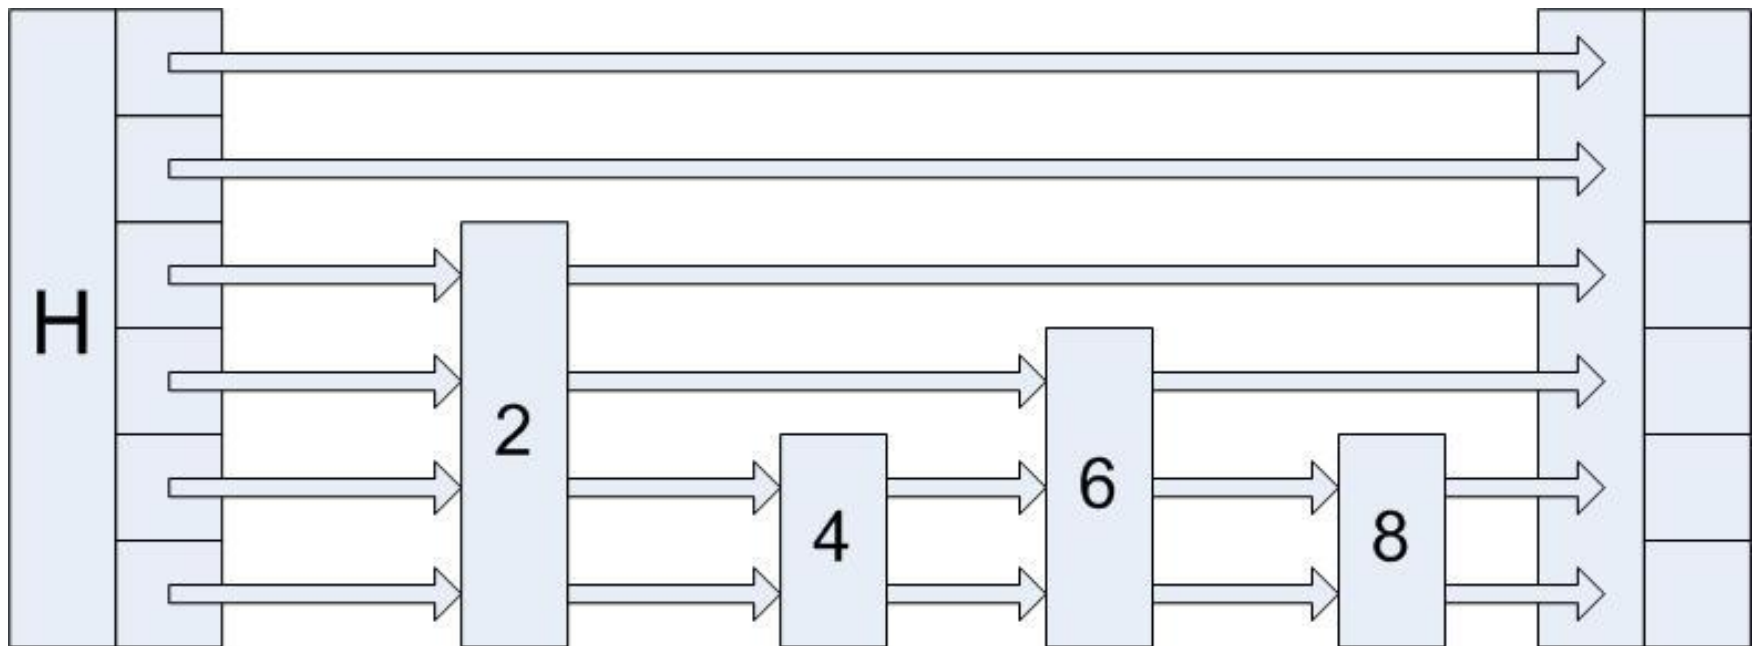

Insertion

- ▶ Insert 6 with level 3:

Insertion

- ▶ Insert 6 with level 3:

Outline

 - ▶ Insertion
 - ▶ **Search**
 - ▶ Deletion
- ▶ Conclusion

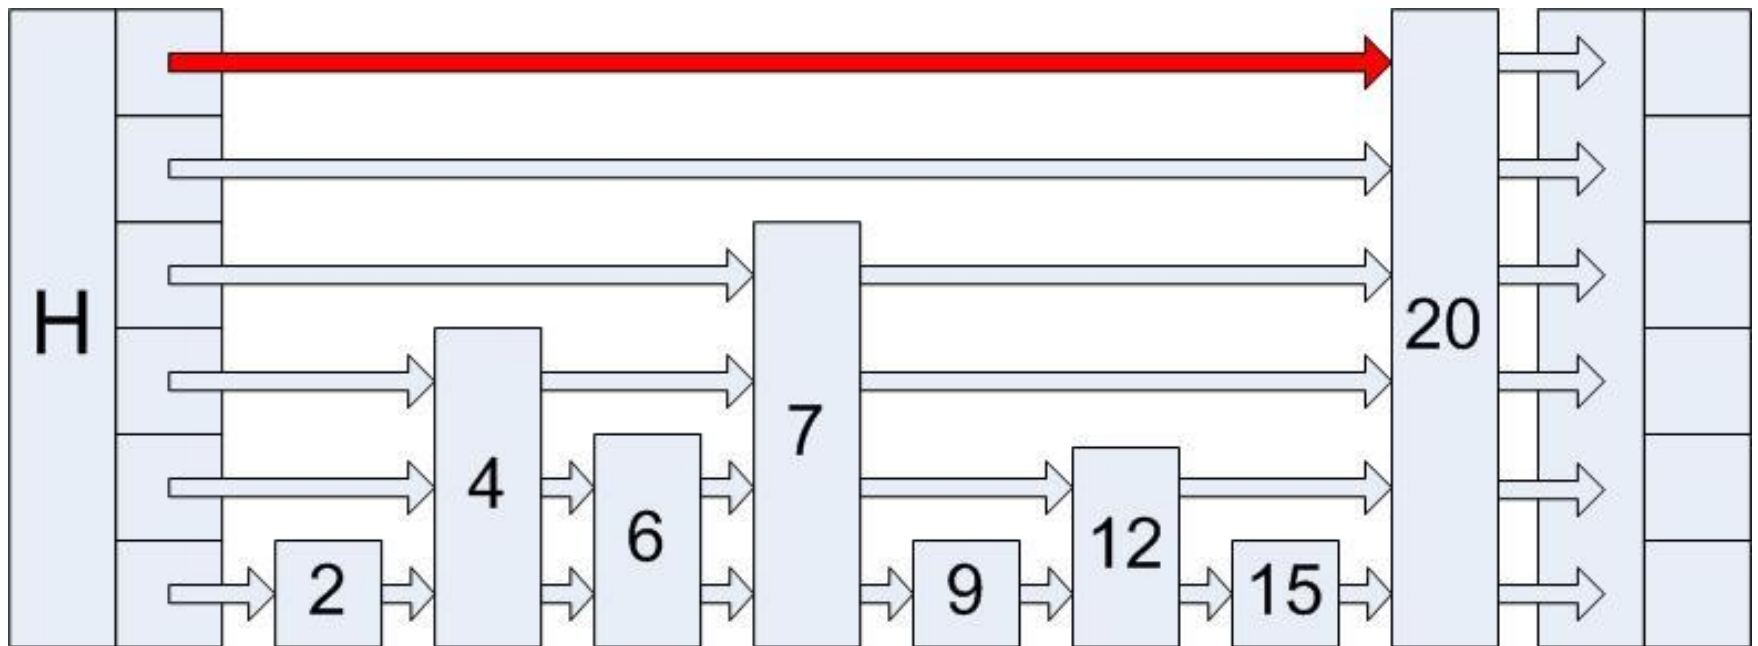

Skip List

- Search for the number 9:

Skip List

- Search for the number 9:

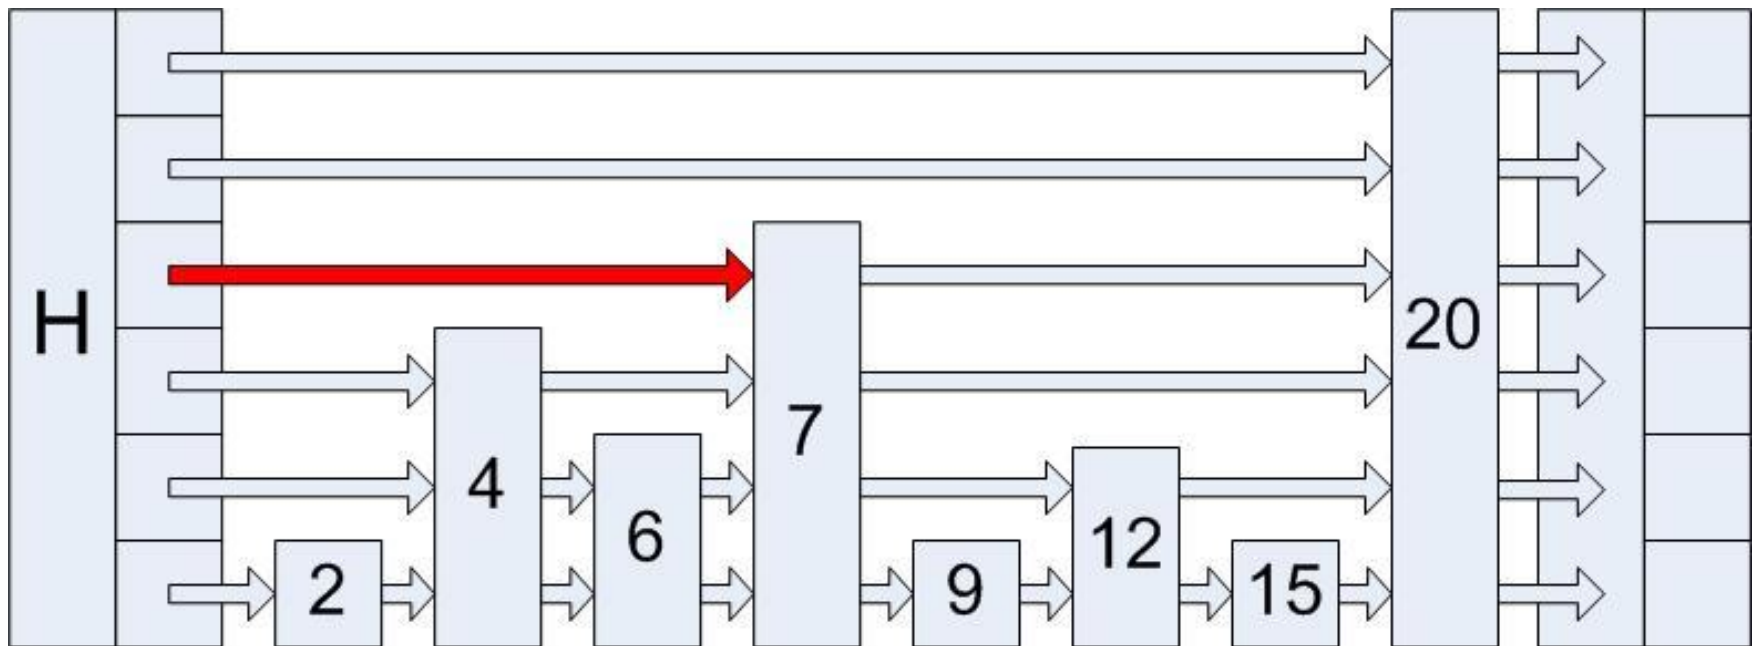

Skip List

- Search for the number 9:

Skip List

- Search for the number 9:

Skip List

- Search for the number 9:

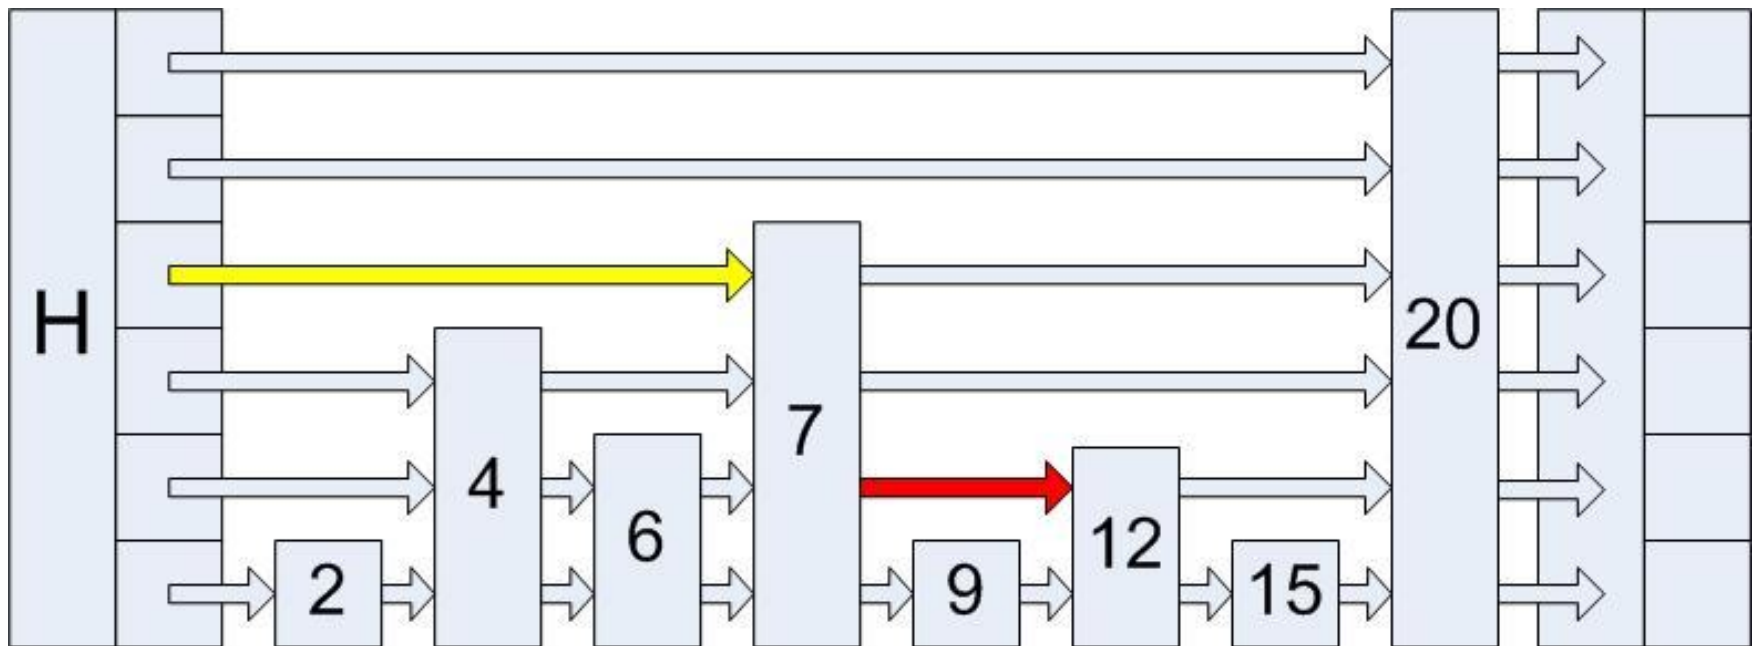

Skip List

- Search for the number 9:

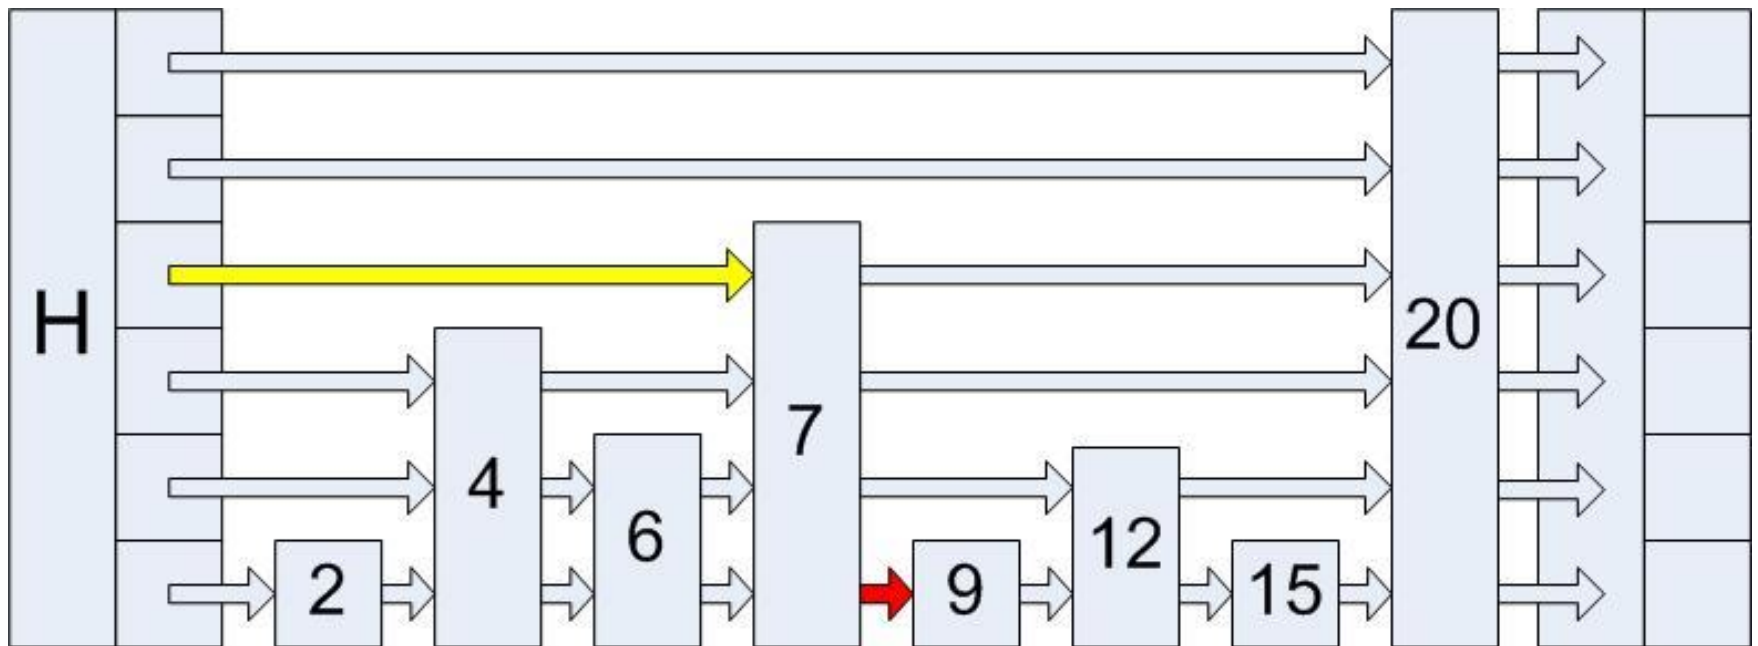

Skip List

- Search for the number 9:

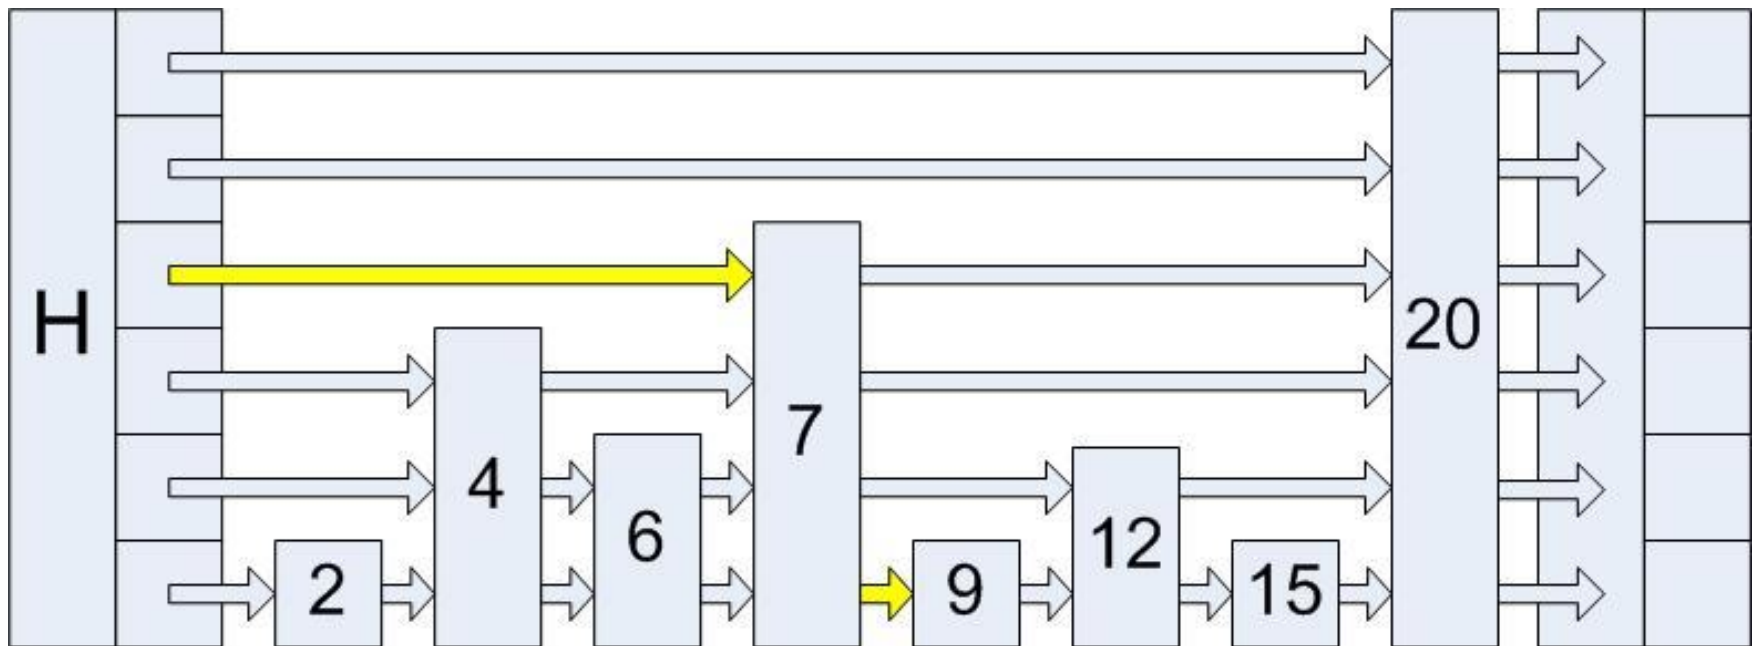

Skip List

- Search for the number 9:

Skip List

- Search for the number 9:

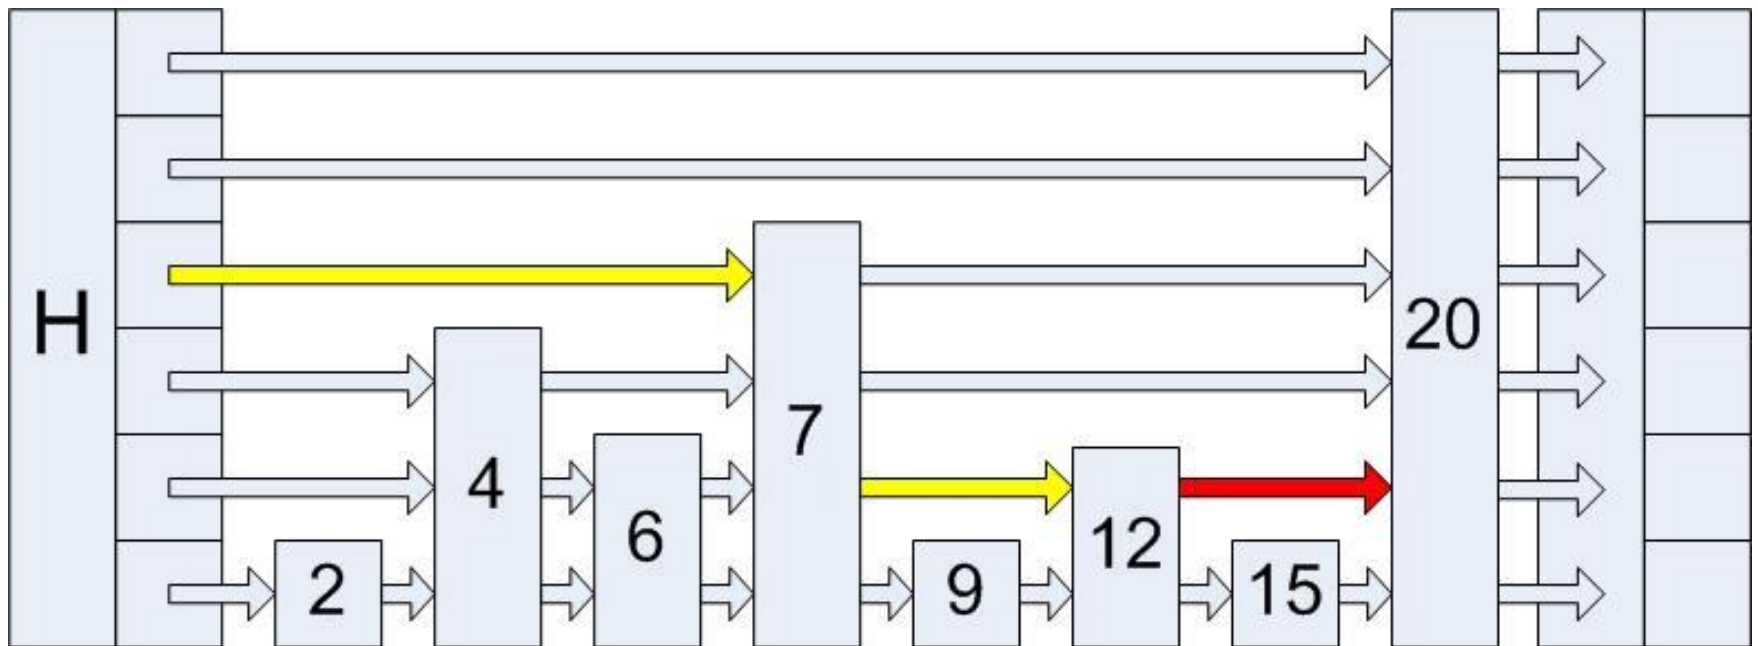

Skip List

- Search for the number 15:

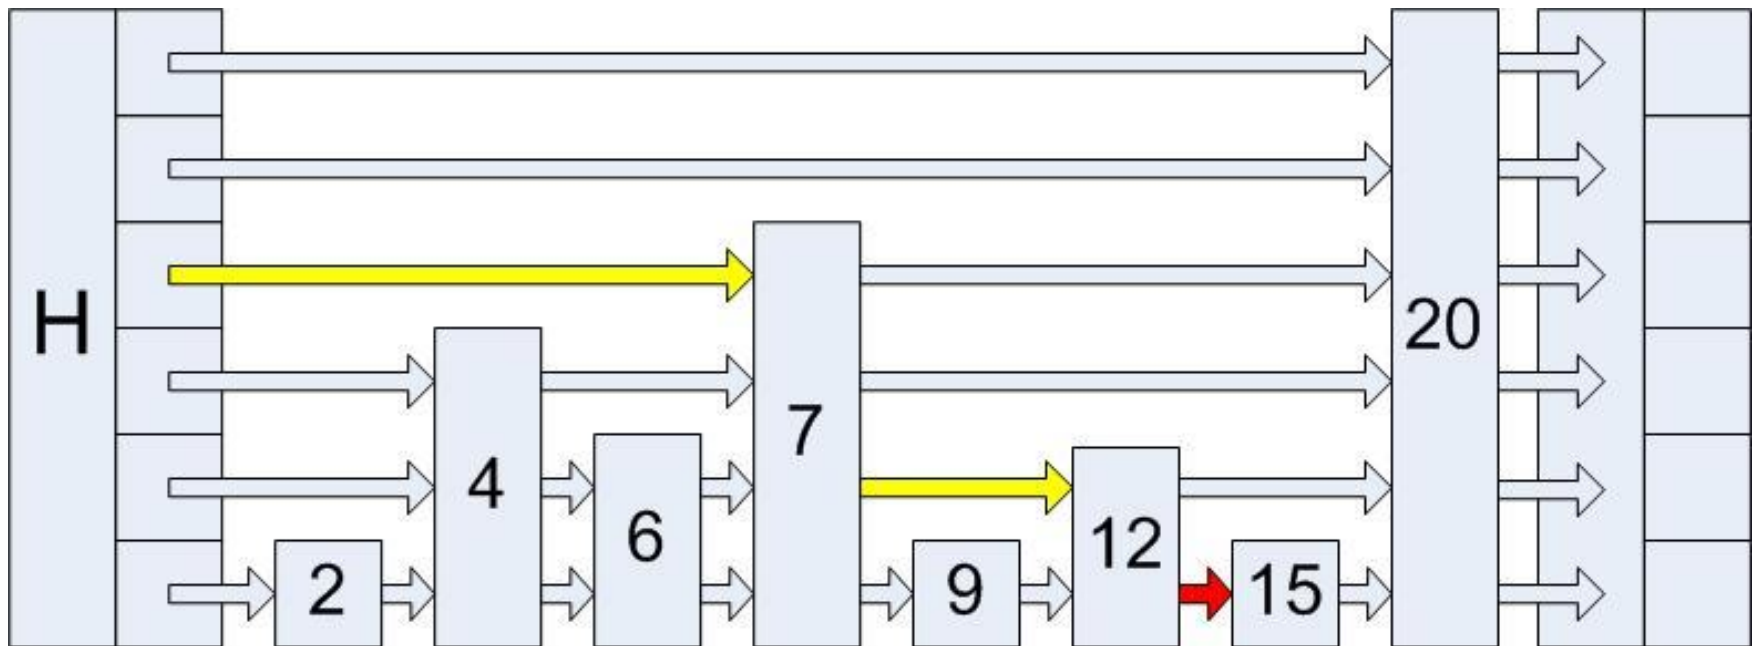

Skip List

- Search for the number 15:

Skip List

- Search for the number 15:

Skip List

- ▶ How many comparisons do we make before we say the number 14 was not found?

Outline

- ▶ Trees
- ▶ **Skip Lists**
 - ▶ Definition
 - ▶ Insertion
 - ▶ Search
 - ▶ **Deletion**
- ▶ Conclusion

Deletion

- ▶ Delete the number 7:

Deletion Algorithm

Delete x from skip list:

Run search to find x .

Delete node x and reassign arrows as necessary.

Deletion

- ▶ Delete the number 7:

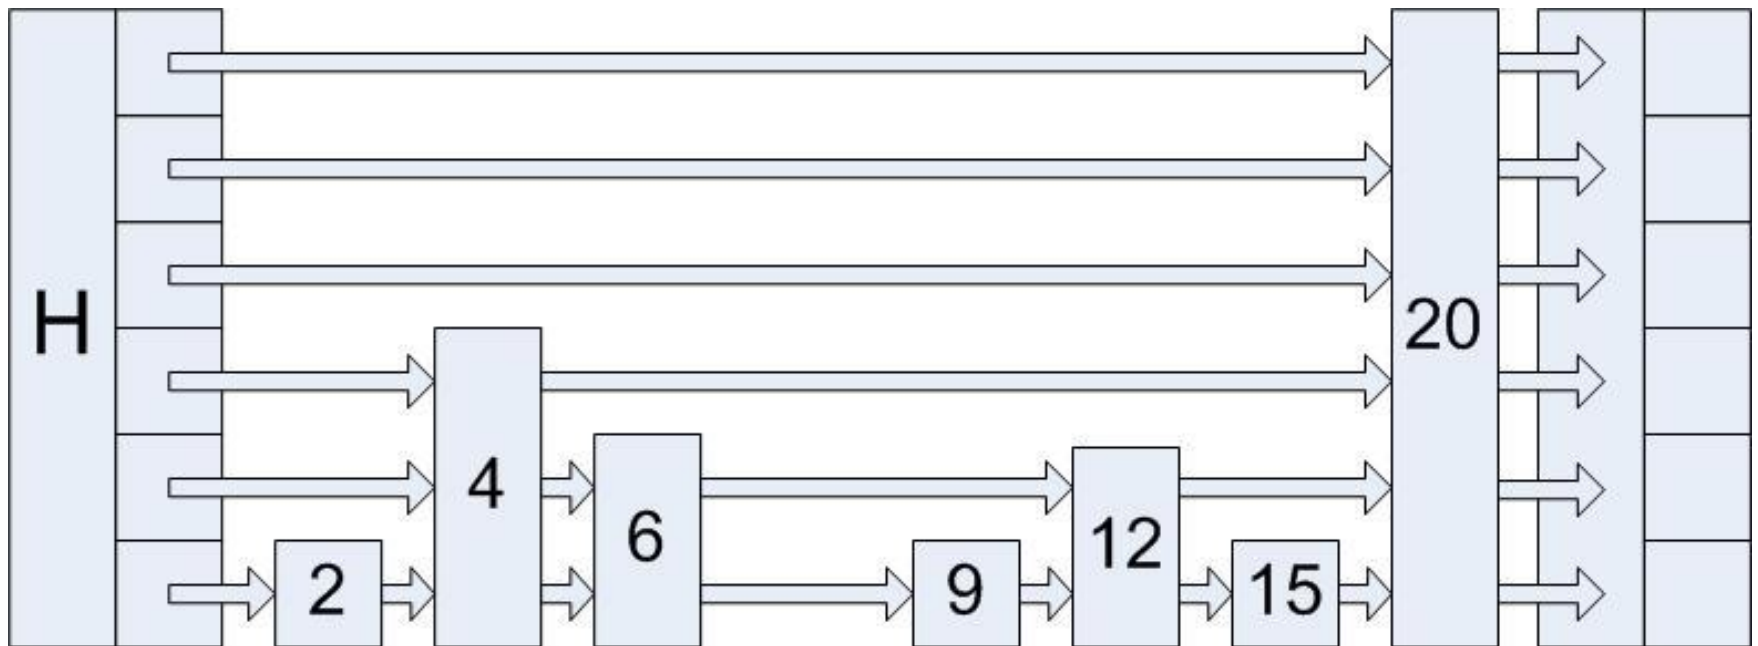

Deletion

- ▶ Delete the number 7:

Deletion

- ▶ Delete the number 7:

Outline

- ▶ Trees

 - ▶ Definition
 - ▶ Insertion
 - ▶ Search
 - ▶ Deletion
- ▶ **Conclusion**

Quick Questions

- ▶ Can the runtime for insert/delete/search be linear?
- ▶ What is a good level to set your maximum level to assuming you know roughly how many elements you will be inserting?
- ▶ If we have no maximum level, what level should we start our search at (assuming we know the number of nodes)?
- ▶ If I implement an `InList(int x)` function that returned a boolean, what is the last level I have to check to return false?
